

Slap Snap®

Bundling cables and wires has been a problem since the first electrical and telephone lines were laid. You now have no need to be concerned with this very necessary operation. Slap Snap® will increase your company's productivity by reducing installation time, decreasing waste and eliminating many safety hazards without disrupting the flow of energy.

The adjustable and reusable Slap Snap® comes in 4 sizes, (1/2 inch to 2 inches), as well as specialized versions for channel struts and distribution racks. The Slap Snap® is adaptable to just about any cabling situation, be it installing a new information system, wiring a building or even laying cable for a rock concert!

Slap Snap®, made of lightweight nylon, enables you to wrap your cables 3-5 times faster than with traditional tie wraps. Slap Snap® can be applied with one hand and is reusable. Productivity is enhanced when you need to add another cable to the bundle as Slap Snap® is easily unclapsed without any special tools and there are no sharp edges that can cause injury.

Slap Snap® is designed to safeguard the flow of current in computer cables, telephone lines, fiber optics, electrical wires and industrial usage from automobiles to aircraft.
